

Inductive data types

Assia Mahboubi

10 juin 2010

In this class, we shall present how *Coq*'s type system allows us to define **data types** using **inductive declarations**.

Inductive declarations

An arbitrary type as assumed by :

Variable T : Type.

gives no a priori information on the nature, the number, or the properties of its inhabitants.

Inductive declarations

An **inductive** type declaration explains how the inhabitants of the type are built, by giving **names** to each construction rule :

Inductive declarations

An **inductive** type declaration explains how the inhabitants of the type are built, by giving **names** to each construction rule :

```
Print bool.
```

Inductive declarations

An **inductive** type declaration explains how the inhabitants of the type are built, by giving **names** to each construction rule :

Print `bool`.

Inductive `bool : Set := true : bool | false : bool.`

Inductive declarations

An **inductive** type declaration explains how the inhabitants of the type are built, by giving **names** to each construction rule :

```
Print bool.
```

Inductive bool : Set := true : bool | false : bool.

```
Print nat.
```

Inductive declarations

An **inductive** type declaration explains how the inhabitants of the type are built, by giving **names** to each construction rule :

```
Print bool.
```

```
Inductive bool : Set := true : bool | false : bool.
```

```
Print nat.
```

```
Inductive nat : Set := O : nat | S : nat -> nat.
```

Inductive declarations

An **inductive** type declaration explains how the inhabitants of the type are built, by giving **names** to each construction rule :

```
Print bool.
```

```
Inductive bool : Set := true : bool | false : bool.
```

```
Print nat.
```

```
Inductive nat : Set := O : nat | S : nat -> nat.
```

Each such rule is called a **constructor**.

Inductive declarations in *Coq*

Inductive types in *Coq* can be seen as the generalization of similar type constructions in more common programming languages.

They are in fact an extremely rich way of defining data-types, operators, connectives, specifications,...

They are at the core of powerful programming and reasoning techniques.

Enumerated types

Enumerated types are types which list and name exhaustively their inhabitants.

```
Inductive bool : Set := true : bool | false : bool.
```

Enumerated types

Enumerated types are types which list and name exhaustively their inhabitants.

```
Inductive bool : Set := true : bool | false : bool.
```

```
Inductive prevert_enum : Set :=  
  | one_stone : prevert_enum  
  | two_houses : prevert_enum  
  | some_flowers : prevert_enum  
  | dozen_of_oysters : prevert_enum  
  | an_other_racoon : prevert_enum.
```

Labels refer to **distinct** elements.

Enumerated types : program by case analysis

Inspect the enumerated type inhabitants and assign values :

```
Definition my_negb (b : bool) :=  
  match b with true => false | false => true.
```

Enumerated types : program by case analysis

Inspect the enumerated type inhabitants and assign values :

```
Definition my_negb (b : bool) :=  
  match b with true => false | false => true.
```

```
Definition is_prevert_animal (x : prevert_enum) : bool :=  
  match x with  
  | dozen_of_oyster => true  
  | an_other_racoon => true  
  | _ => false  
end.
```

Enumerated types : program by case analysis

Inspect the enumerated type inhabitants and assign values :

```
Definition my_negb (b : bool) :=  
  match b with true => false | false => true.
```

```
Definition is_prevert_animal (x : prevert_enum) : bool :=  
  match x with  
  | dozen_of_oyster => true  
  | an_other_racoon => true  
  | _ => false  
end.
```

Eval compute in (is_prevert_animal one_stone).

Enumerated types : program by case analysis

Inspect the enumerated type inhabitants and assign values :

```
Definition my_negb (b : bool) :=  
  match b with true => false | false => true.
```

```
Definition is_prevert_animal (x : prevert_enum) : bool :=  
  match x with  
  | dozen_of_oyster => true  
  | an_other_racoon => true  
  | _ => false  
end.
```

```
Eval compute in (is_prevert_animal one_stone).  
= false  
: bool
```

Enumerated types : reason by case analysis

Inspect the enumerated type inhabitants and build proofs :

```
Lemma bool_case : forall b : bool, b = true ∨ b = false.
```

```
Proof.
```

```
intro b.
```

```
case b.
```

```
  left; reflexivity.
```

```
right; reflexivity.
```

```
Qed.
```

Enumerated types : reason by case analysis

Inspect the enumerated type inhabitants and build proofs :

```
Lemma is_prevert_animalP : forall x : prevert_enum,  
  is_prevert_animal x = true ->  
  x = dozen_of_oysters ∨ x = an_other_racoon.
```

Proof.

```
(* Case analysis + computation *)  
intro x; case x; simpl; intro e.  
(* In the three first cases: e: false = true *)  
  discriminate e.  
  discriminate e.  
  discriminate e.  
(* Now: e: true = true *)  
  left; reflexivity.  
  right; reflexivity.
```

Qed.

Enumerated types : reason by case analysis

Two important tactics, not specific to enumerated types :

- ▶ `simpl` : makes computation progress (pattern matching applied to a term starting with a constructor)
- ▶ `discriminate` : allows to use the fact that constructors are distincts :
 - ▶ `discriminate H` : closes a goal featuring a hypothesis `H` like `(H : true = false)`;
 - ▶ `discriminate` : closes a goal like `(0 <> S n)`.

Recursive types

```
Inductive nat : Set :=  
| 0 : nat  
| S : nat -> nat.
```

Recursive types

```
Inductive nat : Set :=  
| 0 : nat  
| S : nat -> nat.
```

```
Inductive list (A : Type) :=  
| nil : list A  
| cons : A -> list A -> list A.
```

Recursive types

```
Inductive nat : Set :=  
| 0 : nat  
| S : nat -> nat.
```

```
Inductive list (A : Type) :=  
| nil : list A  
| cons : A -> list A -> list A.
```

Base case constructors do not feature self-reference to the type.

Recursive case constructors do.

Recursive types

Let us craft new inductive types :

```
Inductive natBinTree : Set :=
```

Recursive types

Let us craft new inductive types :

```
Inductive natBinTree : Set :=  
| Leaf : nat -> natBinTree
```

Recursive types

Let us craft new inductive types :

```
Inductive natBinTree : Set :=  
| Leaf : nat -> natBinTree  
| Node : nat ->
```

Recursive types

Let us craft new inductive types :

```
Inductive natBinTree : Set :=  
| Leaf : nat -> natBinTree  
| Node : nat -> natBinTree -> natBinTree
```

Recursive types

Let us craft new inductive types :

```
Inductive natBinTree : Set :=
```

```
| Leaf : nat -> natBinTree
```

```
| Node : nat -> natBinTree -> natBinTree -> natBinTree
```

Recursive types

Let us craft new inductive types :

```
Inductive natBinTree : Set :=  
| Leaf : nat -> natBinTree  
| Node : nat -> natBinTree -> natBinTree -> natBinTree
```

```
Inductive term : Set :=  
| Zero : term  
| One : term  
| Plus : term -> term -> term  
| Mult : term -> term -> term.
```

An inhabitant of a recursive type is built from a **finite** number of constructor applications.

Recursive types : program by case analysis

We have already seen some examples of such **pattern matching** :

```
Definition isNotTwo x :=  
  match x with  
  | S (S 0) => false  
  | _       => true  
end.
```

Recursive types : program by case analysis

We have already seen some examples of such **pattern matching** :

```
Definition isNotTwo x :=  
  match x with  
  | S (S 0) => false  
  | _ => true  
end.
```

```
Definition is_single_nBT (t : natBinTree) :=  
  match t with  
  | Leaf _ => true  
  | _ => false  
end.
```

Recursive types : proofs by case analysis

```
Lemma is_single_nBTP : forall t,  
  is_single_nBT t = true -> exists n : nat, t = Leaf n.  
Proof.
```

Recursive types : proofs by case analysis

```
Lemma is_single_nBTP : forall t,  
  is_single_nBT t = true -> exists n : nat, t = Leaf n.
```

Proof.

```
(* We use the possibility to destruct the tree  
   while introducing *)  
intros [ nleaf | nnode t1 t2] h.
```

Recursive types : proofs by case analysis

```
Lemma is_single_nBTP : forall t,  
  is_single_nBT t = true -> exists n : nat, t = Leaf n.
```

Proof.

```
(* We use the possibility to destruct the tree  
   while introducing *)
```

```
intros [ nleaf | nnode t1 t2] h.
```

```
(* First case: we use the available label *)  
  exists nleaf.  
  reflexivity.
```

Recursive types : proofs by case analysis

```
Lemma is_single_nBTP : forall t,  
  is_single_nBT t = true -> exists n : nat, t = Leaf n.
```

Proof.

```
(* We use the possibility to destruct the tree  
   while introducing *)
```

```
intros [ nleaf | nnode t1 t2] h.
```

```
(* First case: we use the available label *)
```

```
  exists nleaf.
```

```
  reflexivity.
```

```
(* Second case: the test evaluates to false *)
```

```
simpl in h.
```

```
discriminate.
```

Recursive types : proofs by case analysis

```
Lemma is_single_nBTP : forall t,  
  is_single_nBT t = true -> exists n : nat, t = Leaf n.
```

Proof.

```
(* We use the possibility to destruct the tree  
   while introducing *)
```

```
intros [ nleaf | nnode t1 t2] h.
```

```
(* First case: we use the available label *)
```

```
  exists nleaf.
```

```
  reflexivity.
```

```
(* Second case: the test evaluates to false *)
```

```
simpl in h.
```

```
discriminate.
```

```
Qed.
```

Recursive types

Constructors are **injective** :

```
Lemma inj_leaf : forall x y, Leaf x = Leaf y -> x = y.
```

```
Proof.
```

```
  intros x y hLxLy.
```

```
  injection hLxLy.
```

```
  trivial.
```

Qed.

Recursive types : structural induction

Let us go back to the definition of natural numbers :

```
Inductive nat : Set := 0 : nat | S : nat -> nat.
```

Recursive types : structural induction

Let us go back to the definition of natural numbers :

```
Inductive nat : Set := 0 : nat | S : nat -> nat.
```

The **Inductive** keyword means that at definition time, this system generates an **induction principle** :

```
nat_ind
  : forall P : nat -> Prop,
    P 0 ->
```

Recursive types : structural induction

Let us go back to the definition of natural numbers :

```
Inductive nat : Set := 0 : nat | S : nat -> nat.
```

The **Inductive** keyword means that at definition time, this system geneates an **induction principle** :

```
nat_ind
: forall P : nat -> Prop,
  P 0 ->
  (forall n : nat, P n -> P (S n)) ->
  forall n : nat, P n
```

Recursive types : structural induction

To prove that for $P : \text{term} \rightarrow \text{Prop}$, the theorem $\text{forall } t : \text{term}, P\ t$ holds, it is sufficient to :

Recursive types : structural induction

To prove that for $P : \text{term} \rightarrow \text{Prop}$, the theorem $\text{forall } t : \text{term}, P\ t$ holds, it is sufficient to :

- ▶ Prove that the property holds for the base cases :
 - ▶ $(P\ \text{Zero})$
 - ▶ $(P\ \text{One})$

Recursive types : structural induction

To prove that for $P : \text{term} \rightarrow \text{Prop}$, the theorem $\text{forall } t : \text{term}, P\ t$ holds, it is sufficient to :

- ▶ Prove that the property holds for the base cases :
 - ▶ $(P\ \text{Zero})$
 - ▶ $(P\ \text{One})$
- ▶ Prove that the property is transmitted inductively :
 - ▶ $\text{forall } t1\ t2 : \text{term},$
 $P\ t1 \rightarrow P\ t2 \rightarrow P\ (\text{Plus } t1\ t2)$
 - ▶ $\text{forall } t1\ t2 : \text{term},$
 $P\ t1 \rightarrow P\ t2 \rightarrow P\ (\text{Mult } t1\ t2)$

Recursive types : structural induction

To prove that for $P : \text{term} \rightarrow \text{Prop}$, the theorem $\text{forall } t : \text{term}, P\ t$ holds, it is sufficient to :

- ▶ Prove that the property holds for the base cases :
 - ▶ $(P\ \text{Zero})$
 - ▶ $(P\ \text{One})$
- ▶ Prove that the property is transmitted inductively :
 - ▶ $\text{forall } t1\ t2 : \text{term},$
 $P\ t1 \rightarrow P\ t2 \rightarrow P\ (\text{Plus } t1\ t2)$
 - ▶ $\text{forall } t1\ t2 : \text{term},$
 $P\ t1 \rightarrow P\ t2 \rightarrow P\ (\text{Mult } t1\ t2)$

The type `term` is the **smallest type** containing `Zero` and `One`, and closed under `Plus` and `Mult`.

Recursive types : structural induction

The induction principles generated at definition time by the system allow to :

- ▶ Program by recursion (Fixpoint)
- ▶ Prove by induction (induction)

Recursive types : program by structural induction

We can compute some information on the size of a term :

```
Fixpoint height (t : natBinTree) : nat :=  
  match t with  
  | Leaf _ => 0  
  | Node _ t1 t2 => Max.max (height t1) (height t2) + 1  
end.
```

Recursive types : program by structural induction

We can compute some information on the size of a term :

```
Fixpoint height (t : natBinTree) : nat :=  
  match t with  
  | Leaf _ => 0  
  | Node _ t1 t2 => Max.max (height t1) (height t2) + 1  
  end.
```

```
Fixpoint size (t : natBinTree) : nat :=  
  match t with
```

Recursive types : program by structural induction

We can compute some information on the size of a term :

```
Fixpoint height (t : natBinTree) : nat :=  
  match t with  
  | Leaf _ => 0  
  | Node _ t1 t2 => Max.max (height t1) (height t2) + 1  
  end.
```

```
Fixpoint size (t : natBinTree) : nat :=  
  match t with  
  | Leaf _ => 1
```

Recursive types : program by structural induction

We can compute some information on the size of a term :

```
Fixpoint height (t : natBinTree) : nat :=  
  match t with  
  | Leaf _ => 0  
  | Node _ t1 t2 => Max.max (height t1) (height t2) + 1  
  end.
```

```
Fixpoint size (t : natBinTree) : nat :=  
  match t with  
  | Leaf _ => 1  
  | Node _ t1 t2 => (size t1) + (size t2) + 1  
  end.
```

Recursive types : program by structural induction

We can access some information contained in a term :

```
Require Import List.
```

```
Fixpoint label_at_occ (dflt : nat)
  (t : natBinTree)(u : list bool) :=
match u, t with
|nil, _ =>
  (match t with Leaf n => n | Node n _ _ => n end)
|b :: tl, t =>
  match t with
  |Leaf _ => dflt
  | Node _ t1 t2 =>
    if b then label_at_occ t2 tl dflt
    else label_at_occ t1 tl dflt
  end
end.
```

Recursive types : proofs by structural induction

We have already seen induction at work on nats and lists.
Here its goes on binary trees :

```
Lemma le_height_size : forall t : natBinTree,  
    height t <= size t.
```

Proof.

```
induction t; simpl.  
  auto.  
apply plus_le_compat_r.  
apply max_case.  
  apply (le_trans _ _ _ IHt1).  
  apply le_plus_l.  
  apply (le_trans _ _ _ IHt2).  
  apply le_plus_r.
```

Qed.

Option types

A polymorphic (like `list`) non recursive type :

Print `option`.

```
Inductive option (A : Type) : Type :=  
  Some : A -> option A | None : option A
```

Option types

A polymorphic (like `list`) non recursive type :

Print option.

```
Inductive option (A : Type) : Type :=  
  Some : A -> option A | None : option A
```

Use it to lift a type to version with default value :

```
Fixpoint olast (A : Type)(l : list A) : option A :=  
  match l with  
  | nil => None  
  | a :: nil => Some a  
  | a :: l => olast A l  
end.
```

Pairs & co

A polymorphic (like list) pair construction :

Print pair.

```
Inductive prod (A B : Type) : Type :=  
  pair : A -> B -> A * B
```

Pairs & co

A polymorphic (like list) pair construction :

Print pair.

```
Inductive prod (A B : Type) : Type :=
  pair : A -> B -> A * B
```

The notation $A * B$ denotes $(\text{prod } A \ B)$.

The notation (x, y) denotes $(\text{pair } x \ y)$ (implicit argument).

```
Check (2, 4).      : nat * nat
```

```
Check (true, 2 :: nil). : bool * (list nat)
```

Fetching the components :

```
Eval compute in (fst (0, true)).
= 0 : nat
```

```
Eval compute in (snd (0, true)).
= true : bool
```

Pairs & co

Pairs can be nested :

```
Check (0, 1, true).
```

```
      : nat * nat * bool
```

```
Eval compute in (fst (0, 1, true)).
```

```
      = (0, 1)
```

```
      : nat * nat
```

This can also be adapted to polymorphic n-tuples :

```
Inductive triple (T1 T2 T3 : Type) :=
```

```
  Triple T1 -> T2 -> T3 -> triple T1 T2 T3.
```

Record types

A record type bundles pieces of data you wish to gather in a single type.

```
Record admin_person := MkAdmin {  
  id_number : nat;  
  date_of_birth : nat * nat * nat;  
  place_of_birth : nat;  
  sex : bool}
```

They are also inductive types with a single constructor !

Record types

You can access to the **fields** :

```
Variable t : admin_person.
```

```
Check (id_number t).
```

```
      : nat
```

```
Check id_number.
```

```
fun a : admin_person =>
```

```
    let (id_number, _, _, _) := a in id_number
```

```
    : admin_person -> nat
```

In proofs, you can break an element of record type with tactics `case/destruct`.

Warning : this is **pure** functional programming...
